Thoughts

With over 15 years as an organic vegetable farmer, you may wonder what brings me out of the dirt and into the world of software development. Developing systems for managing complex sets of data is a key part of farming, and over the years I've built custom databases for crop management.

During one season at the farm, we grow over 100 varieties of vegetables, herbs, and flowers. Each variety has a unique set of attributes, needs, and functions. Take for instance - `timeToMaturity`, `nurientInputs`, `waterRequirements`, `optimalSunlight`. A complex system impacted by weather, demand, costs, soil - but motivated by a desire to get fresh produce to people's tables. These are not that different, from the reasons I enjoy coding - diving deep into find solutions to an ever-evolving array of problems.
